

Facility-Wide Alerting Keeps Staff Mobile and Connected

Provider 680 Nurse Call includes flexible options to extend Nurse Call well beyond the nursing station. These options include wireless phone integration, text alerts, and automated overhead announcements that notify caregivers of events while keeping them mobile and tending to the safety and needs of their patients or residents. Timely responses to routine or urgent situations can positively affect patient/resident satisfaction and safety.

Facility-Wide SIP Wireless Phone Integration

Provider 680 supports SIP (Session Initiated Protocol) phone integration to the latest wireless phone technology offered by Cisco, Spectralink, Ascom, and others. Active calls route directly to the assigned caregiver's SIP phone anywhere throughout the facility.

Answering calls directly, caregivers can reassure patients/residents and find out what they need. The wireless phones save wasted trips as staff already know what is needed before going to the calling room. Wireless phones also keep the facility quiet from unnecessary overhead pages. When wireless phone group text alerts are initiated, they notify the entire caregiver team of high priority events, such as a Code call for the Code Crash Team or a unit-wide Staff Emergency call.

Base Station Wireless Phone Integration

Provider 680 includes a wireless base station caller ID telephone option for facilities when a facility-wide wireless phone system is simply too expensive. This wireless phone option routes calls to a caregiver phone within the range of a wireless base station telephone and is often used when staffing down at night; allowing caregivers to leave the nursing station while still able to answer any patient or resident calls.

Text Alerts

Pocket paging can be an extremely cost effective way to alert caregivers throughout an entire facility or across a multi-building campus. When a patient/resident places a call, the text message is immediately routed to the caregiver's pager showing the room, bed, and call priority. If a caregiver is occupied, their call is automatically routed to the next caregiver on the team to speed the response. High priority calls, such as Bed Exit or Staff Emergency, are routed to teams of caregivers so the closest team members can assist as quickly as possible.

Automated Overhead Paging

On its own or to complement wireless phones or pocket pagers, the automated overhead paging option announces high priority patient/resident calls over corridor speakers. Minimizing disruptions, only high priority calls such as Bed Exit or Door Alarm announce over the corridor speakers near the alarm. This automated audio page gives the exact location and type of call for a quick staff response.

Scalable Solutions

The flexibility of Provider 680 gives facilities the wireless and alerting options that best support their workflows and budget. When needs change, the options can easily be added to an existing system to complement the standard Nurse Call alerts. Multiple modes of alerting reaches the closest caregivers who are available to respond quickly to urgent situations.
